

# EXERCISE: Absolute value of a number

Calculate the absolute value of the number, i.e. make a negative number positive.

The absolute value removes the 'minus' from negative number. It leaves the positive and zero value unchanged.

**-5** is to become **5**.

**4** is to be **4**.

**-1** is to become **1**.

**0** is to be **0**.

- 1) Get the value from the user and save it to the variable
- 2) If the number is negative then change the value of the variable to be positive.
- 3) Print the result on output
